

// Day 46 of 60

DATABASES

PostgreSQL vs MySQL

→ Swipe through all 6 slides

The Battle

Two giants, different strengths

MySQL:

most popular database
in the world

PostgreSQL:

most advanced open-source
database in the world

// Both are excellent.
// They just optimize
// for different things.

There's no universal winner

When MySQL Wins

Read-heavy, simple workloads

MySQL excels at:

- Simple SELECT queries
- Read-heavy traffic
- InnoDB row-level locking
- Replication out of the box

Great for:

- Blogs / CMS
- WordPress / Drupal
- Basic CRUD apps

Simplicity has real value

When Postgres Wins

Complex queries, complex data

Postgres excels at:

- Complex JOINS
- Window functions
- CTEs and recursion
- Geospatial (PostGIS)
- Full-text search
- Custom data types

```
// Built for analytics  
// and complex domains
```

Postgres is closer to a Swiss Army knife

JSON Support

Both have it. One does it better.

MySQL JSON:

- ✓ Stored
- ✗ Limited indexing

Postgres JSON / JSONB:

- ✓ Stored binary (JSONB)
- ✓ GIN indexes
- ✓ Query as fast as Mongo
- ✓ Mix relational + document

// often replaces NoSQL

Postgres + JSONB = relational MongoDB

Concurrency (MVCC)

Readers and writers don't fight

MVCC = Multi-Version
Concurrency Control

In Postgres:

Readers never block writers

Writers never block readers

```
// Each transaction sees  
// its own snapshot in time  
// = high throughput
```

MVCC is why Postgres handles spikes well

The Verdict

Pick based on the workload

Use MySQL if:

- Read-heavy + simple
- Already using LAMP stack
- Replication is critical

Use Postgres if:

- Complex queries
- Geospatial / analytics
- Heavy JSON usage
- You want JSON+SQL combo

When unsure → Postgres is the safer default

done = true
